

Climate change, Artisanal Fisheries and Human Dimension

Methodology

In order to achieve the objectives mentioned above an approach is proposed which combines several techniques and methods. These in turn are meant to complement each other in their thematic and geographic scope by focusing on case studies with similar characteristics and which present common challenges for research - particularly manifest in the variety of artisanal fisheries found throughout the area of study.

Participatory research and interviewing techniques will generate most of the data in this research project. Methods and tools for vulnerability and adaptation assessment will be used. Specific methods such as multi-criteria models, socio-economic assessment, and econometric modelling will also be applied, for which information will be collected from both primary and secondary sources.
